NOI CGAP ENI_2 a cDNA library containing the following tissue(e]: Enchondroma cell line (2 cell lines). The library was constructed according to Bonaido, Lennon and Soares, Genome Research, 6:791-806, 1996. First strand cDNA synthesis was primed with an oligo-dT primer containing a Not I site, Double stranded cDNA was ligated to an EcoR adaptor, digested with Not I and cloned directionally into pT773-Pac vector. The oligonaclectide used to prime the synthesis of first-strand cDNA contains a library tag sequence that is located between the Not I site and the (dT)s tail. The sequence tag for this library is CCGGTCACTC. The cell lines was provided by Dr Jame Martin from University of Iowa.

adaptor, digested with Not I, and cloned directionally into pT7T3-Pac vector. The oligonucleotide used to prime the synthesis of first-strand coNA contains a library tag sequence that is located between the Not I site and the (dT)18 tail. The sequence tag for this library is CGCGTATACC. This library was created for the program, Gene Discovery in the Visual System, supported by National Eye Institute (NEI).

An isolated nucleic acid molecule for the treatment of angiogenesis-related disorder, such as cancers or diabetic retinopathy, encodes an endostatin protein.

Claim 14; Fig 3; 56pp; English.

The present invention provides the protein and coding sequences of canine pro-endostatin and endostatin. The sequences can be used in the treatment and diagnosis of angiogenesis related disorders, including cancer, rheumatoid arthritis, psoriasis, retinopathy, macular degeneration, corneal graft rejection, neovascular glaucoma, retrolental fibroplasia, rubeosis, obler-Webber Syndrome, mycoardial angiogenesis, plaque neovascularisation, telangiectesia, haemophiliac joints, angiofibroma, wound granulation, coronary collaterals, cerebral collaterals, artificonence and formations, ischaemic limb angiogenesis, diabetic neovascularisation, and fractures. The present sequence is the canine pro-endostatin protein sequence

New peptide useful for the preparation of medicaments with antiangiogenic activity that may be used in treating tumors or metastases, comprises a sequence corresponding to fragments of human endostatin.

Chillemi F, Vicentinie LMT, Francescato P;

WPI; 2002-698655/75.

sequences corresponding to the human endostatin polypeptide sequence, its salt or non-toxic derivative. The peptides are useful in the preparation of medicaments with antiangiogenic activity which may be useful in treating tumours or metastases. This sequence represents a murine

endostatín polypeptide

Sequence 184 AA;

The invention relates to peptide comprising 20-50 amino acids with

Disclosure; Fig 1; 24pp; English.

```
The patent discloses a DNA molecule encoding a fusion protein comprising a signal sequence, an immunoglobulin Fc region, and an angiogenesis can signal sequence an immunoglobulin Fc region, and an angiogenesis continuity or combinations of them. The fusion protein (immunofusin) is activity, or combinations of them. The fusion protein (immunofusin) is used to inhibit angiogenesis and to treated include solid tumours, blood born tumours, tumour metaetasis, benign tumours including mediated by angiogenesis. Conditions that may be treated include solid tumours, blood born tumours, tumour metaetasis, benign tumours including care undour activity for the protein of seases of diabetic retinopathy, retinopathy of prematurity, macular angiogenic diseases diabetic retinopathy, retinopathy of prematurity, macular elements of diseases can observate and osler-Webber syndrome; myocardial angiogenesis, plangue neovascular fastion, telangietisals, hemophiliac joints, and excessive or abnormal stimulation of endothelial cells, intestinal cells, atherosclerosis, sclerodermal and hypertrophic scarse, i.e. Rebloid scars: The DNA constructus may be used in gene therapy. The present sequence is a canine endostatin used in the construction of immunofusin containing canine immunoglobulin Fc fragment
Novel fusion protein of angiostatin or endostatin and an immunoglobulin FC region, useful for treating conditions mediated by angiogenesis, such as rheumatoid arthritis, tumors and macular degeneration.

The sequence represents Human Endostatin(TM) C-terminus minus 2 protein,
a natural variant lacking the C-terminal 2 amino acids of Endostatin(TM)
c recovered from fermentations of Pichia patorists cultures harbouring a
expression plasmid containing the Endostatin(TM) DNA sequence given in
AAS00867. The new method of the invention is useful for producing,
c recovering and purifying Endostatin (TM) from biological sources, such as
biological fluids, tissues, cells, culture media, and fermentation media.
Endostatin(TM) is useful for treating angiogenesis mediated diseases,
biological fluids, tissues, cells, culture media, and fermentation media.
Endostatin(TM) is useful for treating angiogenesis mediated diseases,
benign tumours, e.g. haemangioma, rounell arthitis, psoriasis,
c trachomas, and pyogenic granulomas, rheumatoid arthitis, psoriasis,
c trachomas, and pyogenic granulomas, rheumatoid arthitis, psoriasis,
c trachomas, colon cancer, retrolental fibroplasia, rubecsis, Osler-Webber
CS yndrome, myocardial angiogenesis, plaque neovascularisation,
c plangiectasia, haemophiliac joints, angiofibroma, and wound granulation.
c telangiectasia, haemophiliac joints, angiofibroma, and wound granulation.
c telangiectasia, haemophiliac joints, angiofibroma, and wound granulation.
c telangiectasia, neovocardam and hypertrophic scars. Higher yields of
more purified, and biologically active Endostatin(TM) are obtained by the
c new method. Endostatin(TM) can be stored in buffers for extended periods
of time, and also subjected to lyophilisation, while preserving
c production is avoided, preventing unwanted potential cellular lysis and
contamination with additional proteins, pigments, enzymes and other
                                                                                                                                                                                Producing Endostatin protein for treating angiogenesis mediated diseases such as solid tumors, comprises recombinantly producing the protein using an expression system, and recovering and purifying the protein.
                                                                                                                                                                                                                                                                                               Claim 5; Page 30; 67pp; English

Human endostatin protein fragment (first entry) 14-MAR-2000

This sequence is a fragment of the human endostatin protein. Endostatin is an approximately 20kD C-terminal globular domain of the collagen-like protein collagem XVIII. Protein oligomers consisting of more than one endostatin collagem XVIII. Protein oligomers consisting of more than one endostatin monomer have anti-tubulogenic effects and induce controlly and inhibit tubulogenic effects. The oligomers can also be used to treat metastatic cancers, tumours, closuration of cells, and inhibit tubulogenesis and tumourigenesis. The oligomers can also be used to treat metastatic cancers, tumours, columnatoid arthritis, psoriasis, coular angiogenic disease, obsler-Webber syndrome, plaque neovascularisation, telangiectasia, haemophiliac joints, angiofibroma and wound granulation. The oligomers can also be used to creat diseases that have angiogenesis as a pathological consequence e.g. ulcers. The endostatin oligomers can also be used to columns for isolating antibodies or receptors. Passive antibody therapy columns for isolating antibodies or receptors. Passive antibody therapy columns antibodies that specifically bind endostatin digomer as well as angiogenesis-dependent processes such as reproduction, development, wound antisera directed to the Pab regions of endostatin oligomer antibodies can be administered to the Pab regions of endostatin oligomer antibodies can be administered to bind endostatin oligomers. Endostatin, scatter factor activity, human, tubulogenesis, psoriasis, metastatic cancer, tumourigenesis, ocular angiogenic disease, rheumatoid arthritis, Osler-Webber syndrome, telangiectasia; haemophiliac joint; angiofibroma; wound granulation. New endostatin oligomers, used for treating e.g. tumors Disclosure; Page 6; 44pp; English.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present sequence is an endostatin protein which is the carboxy terminal protein of human collagen XVII. Recombinant mouse endostatin (10 mg/kg) was administered subcutaneously to mice implanted with Lewis lung carcinomas. There was tumour mass regression non-detectable levels after 12 days of therapy due to the anglogenesis inhibitory activity of endostatin. Thus the protein is useful for treatment of anglogenesis. Compared to the cancer the polynucleotide and polypeptide sequences of this endostatin are useful for treating and diagnosis of tumours, ocular cangingenic diseases. Osler-webber syndrome, myccardial anglogenesis, plaque neovascularisation, telangiectasia, haemophiliac joints, anglofibroma and wound granulation of endothellal cells e.g. intestinal excessive or abnormal stimulation of endothellal cells e.g. intestinal as a birth control agent by reducing or preventing uterine as a birth control agent by reducing or preventing uterine cells, by classue that express high levels of endostatin, eg. tumour cells, by generating cDNA from mRNA using reverse transcriptase and then amplifying
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Novel endostatin capable of inhibiting endothelial cell proliferation and angiogenesis, useful for treating angiogenesis-dependent cancers and as birth control agents.

The present sequence is human endostatin. Endostatin may be conjugated onto the anti-VEGF antibodies of the present invention. The anti-VEGF antibodies of the present invention. The treatment and diagnosis of cancer, especially vascularised solid tumours
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               120

The specification describes multifunctional proteins which comprise combinations of angiostarin, endostatin, interferon, thrombospondin, interferon-inducible protein and platelet factor 4, and have antiangiogenic and/or anti-tumor activity. The multifunctional protein may exhibit useful properties such as having similar or greater biological activity when compared to a single factor or by having improved half-life or decreased adverse side effects, or a combination of these properties. The proteins can be used for treating an angiogenic-mediated disease, e.g. cancer, diabetic retinopathy, macular degeneration, or arthritis. They can also be used for inhibiting the production of tumor cells characteristic of lung, breast, ovarian, prostate, pancreatic, gastric, colon, renal, bladder cancers; melanoma, hepatoma, sarcoma and lymphoma) in a patient and for inhibiting tumor growth. The present sequence is multifunctional proteins useful for treating angiogenic-mediated Disclosure; Page 106-107; 121pp; English.

This invention describes a novel viral gene therapy vector comprising a nucleic acid molecule encoding an anti-angiogenic polypeptide chosen from human or murine angiogentin, human or murine endostatin and angiogenesis-inhibiting fusions and fragments, where the viral vector is sufficiently attenuated for use in human gene therapy. The products of the invention have anti-angiogenic, cytostatic, anti-diabetic and ophthalmological activity. The vector is used in gene therapy for inhibiting tumour growth in humans harbouring a solid tumour. The vector expresses an anti-angiogenic polypeptide. An additional use comprises treatment of diabetic retinopathy, where the anti-angiogenic polypeptide inhibits angiogenesis in the vicinity of the retina. The vector is administered to cells exvivo and then administered to the patient Disclosure; Page 74-75; 83pp; English. Anti-angiogenic gene therapy vectors. WPI; 1999-357696/30, N-PSDB; AAX77719.

```
This invention relates to angiogenesis-inhibiting protein receptors, and the DNA sequences encoding them. Angiogenesis is the generation of new blood vessels into a tissue, and normally occurs in wound healing, foetal and embryonal development and the formation of the corpus luteum, condemetrium and placenta. Angiostatin is a protein (see AAB16450 and AAA88202) involved in angiogenesis, and has an amino acid sequence similar to that of a plasminogen fragment (see murine plasminogen con AAA88203). Angiostatin has the ability to inhibit angiogenesis.

CAAB16490). Angiostatin has the ability to inhibit angiogenesis.

CAAB16303). Sequences AAA88242 and AAB16522 represent coding and protein sequences of human laminin. Laminin is an angiostatin binding protein.

CON AAA88203 is and protein receptor fragments of the invention. The angiogenesis-inhibiting protein receptor fragments of the invention. The confides bind either angiostatin or endostatin and can be used in methods of the tracting protein and can be used in methods contracting in diseases and processes that are mediated by angiogenesis, crohn's diseases and processes that are mediated by angiogenesis, crohn's diseases and processes that are mediated by angiogenesis, crohn's diseases and processes that are mediated by angiogenesis, crohn's diseases and processes that are mediated by angiogenesis, crohn's diseases seek, fractures, placentation and cat scratch fever. They are useful for the detection and prognosis of cancer. DNA sequences A628204-A628241 encode the peptides of the invention
                                                                                                                                                                                                                                                 New angiogenesis-inhibiting protein receptors, useful in methods for treating diseases and processes that are mediated by angiogenesis, s as solid tumors, psoriasis, scleroderma and myocardial angiogenesis.
                                                                                                                                                                                                                                                                                                                                                                 Disclosure, Fig 3; 100pp; English

Natl. Acad. Sci. U.S.A. 89:10144-10148 (1992).

-I TISSUE SPECIFICITY: Expressed predominantly in internal organs such as drenal gland, pancreas and kidney.

-I PTM: Prollines at the third position of the tripeptide repeating unit (G-X-Y) are hydroxylated in some or all of the chains.

-I SIMILARITY: BELONGS TO THE FIRSTL-ASSOCIATED COLLAGENS WITH INTERRUPTED HELICES (FACIT) PAMILY.

-I SIMILARITY: Contains 1 TSP N-terminal (TSPN) domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Homo sapiens (Human).

Dev. Biol. 180:273-283(1996).

-!- PUNCTION: MAY REGULATE THE TRANSCRIPTION OF SPECIFIC GENES DURING NORMAL DEVELOPMENT. MAY PLAY A ROLE IN CRANIOFACIAL DEVELOPMENT AND DIGITAL DEVELOPMENT, AS WELL AS DEVELOPMENT OF THE CENTRAL NERVOUS SYSTEM AND GASTROINTESTINAL TRACT. IMPLICATED IN THE TRANSDUCTION OF SH4 SIGNAL (BY SIMILARITY).

-!- SUBCELLULAR LOCATION: Nuclear:
-!- SIMILARITY: BELONGS TO THE GLI FAMILY OF C2H2-TYPE ZINC-FINGER
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         01-NOV-1997 (Rel. 35, Created)

Lin Radin Res. Mol. Brain Res. 43:57-64(1996).
Lin FUNCTION: NMDA receptor subcype of glutamate-gated ion channels with high calcium permeability and voltage-dependent sensitivity.
Lin Radin Res. Mol. Brain Res. Composition of an epsilon subunit and a zeta subunit.
Ci. SUBGELUTAR LOCATION: Integral membrane protein.
Linsup SPECIFICITY: Mainly in brain with predominant expression is candate nucleus, corpus callosum, subchalamic nuclei and chalamus.
Composition of the heart, skeletal muscle and pancreas.
Composition of the ligand-gated innit.

MEDLINE-95050487; PubMed=7961658;
TSUCHINA M., Hara N., Yamada K., Osago H., Shimoyama M.;
"Cloning and expression of cDNA for arginine-specific ADFTiboyltransferase from chicken bone marrow cells.";
J. Biol. Chem. 269:27457(1994).
-I- CATALYTIC ACTIVITY: NAD(+) + L-arginine = nicotinamide + N(2)-(ADF-D-ribosyl)-L-arginine.
-!- SUBCELULAR LOCATION: THE MATURE ENZYME IS PROBABLY SECRETED FROM GRANULOCYTES INTO THE EXTRACELULAR SPACE.
-!- SIMILARITY: Belongs to the Arg-specific ADP-ribosyltransferase 312 AA. NCBI_TaxID=9031;
